

pi for sage

The story starts here

We've helped hundreds of organisations reduce their reliance on Excel.

sage

PLAY WITH PI

By using pi Dashboard they can now access and share data throughout their whole business, enabling business leaders, managers and front-line employees to make better, more informed decisions from real-time data.

Before they discovered pi, these are some common statements we heard:

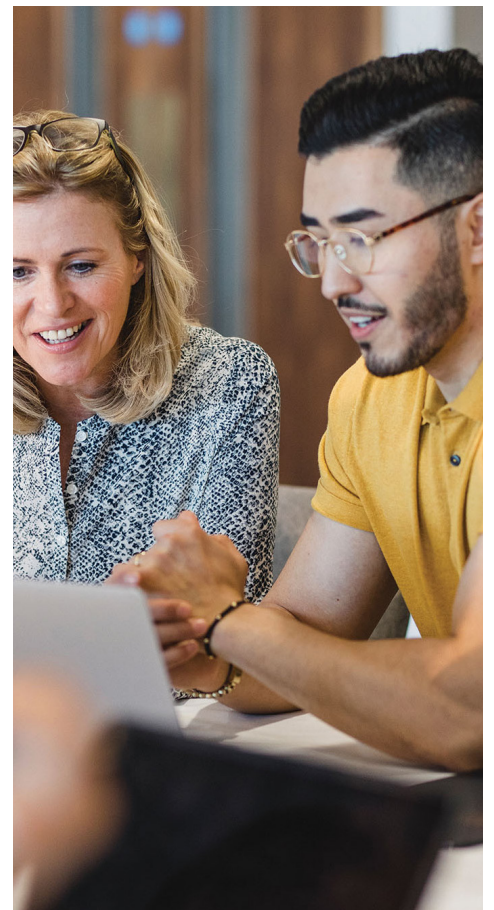

"It takes me far too long to create reports in Excel, and administering the spreadsheet is a nightmare!"

"I can't run my own reports – this is left to the Excel guru in the office."

"We have multiple software applications and I can't combine reports from these systems"

"Everyone has created their own reports and now we don't know which data is correct!"

In every business we encounter, Excel is used to extract data, typically from multiple systems, and is then wrangled to provide insight back to the business. The problem with this is it is inefficient, not real-time, susceptible to human error, and is not secure.

pi helps

Pi instantly removes key person dependency, reduces the time to create and administer reports and with pre-defined calculations remove human error from the equation. You can trust your data and start making quicker and data-informed decisions.

- Pre-configured for Sage 200
- Simple and easy to use
- Combines data from multiple applications
- Provides drill-downs so you can trust your data
- Provides data in a highly secure environment

PLAY WITH PI

Let's unlock the true power of your data

Empower your business to make better decisions

Using pi, employees are empowered to slice and dice the data to make informed decisions, helping to implement long-lasting change. Employees can see in real-time how they're resolving issues and contributing to team and business objectives.

Improve processes and streamline your business

As we're real time, you can use pi to generate real-time alerts to automatically email sales people when their customer has an overdue invoice, identify support requests which have exceeded SLAs, or to isolate orders which can't be fulfilled. This is a really simple way to streamline business processes and create accountability across your whole organisation.

Create competition and improve performance

In fast-paced organisations, TV screens connected to pi are used to present leader boards for individuals and team contributions, highlight current performance against targets, and to bring attention to business-critical actions. This can have an enormous positive impact on performance.

Create change that's long lasting

Top down change is often required, but bottom-up change has been proven to be longer lasting and more effective. Employees need to be empowered to make decisions and to do this they need access to accurate data about key information, meaning the right decision to best benefit the business will be made.
